

**ABSTRACT**

The present invention relates to a device which has been particularly conceived for collecting gravel and/or calculi expelled through the urethra, for example from a renal patient with kidney stones.

- 5        The object of the invention is to achieve that said calculi and/or gravel can be collected comfortably and efficiently when they are expelled while urinating, wherever the patient may be, and to learn the approximate volume of gravel expelled, and all this with a device that the patient can comfortably and discretely carry with him or her at anytime and in any place.
